

➤ Sorting a List

➤ Multiple Complex Inputs

➤ Natural Numbers

Sorting Lists

- Implement **sort-list**, which takes a list of numbers and returns a sorted list of the same numbers

- **Sorting a List**
- **Multiple Complex Inputs**
- **Natural Numbers**

Multiple Complex Arguments

- Implement **append-lists**, which takes two lists of numbers and returns a list with all of the numbers from the first list followed by all of the numbers from the second list
- Implement **parallel-sum**, which takes two lists of numbers (of the same length) and returns a list of sums
- Implement **merge-lists**, which takes two *sorted* lists of numbers and returns a sorted list with all of the numbers

```
; append-lists : list-of-num list-of-num -> list-of-num  
  
(append-lists empty empty) "should be" empty  
  
(append-lists (list 1 3 5) (list 0 4 6))  
"should be" (list 1 3 5 0 4 6)
```

Multiple Complex Arguments

- Implement **append-lists**, which takes two lists of numbers and returns a list with all of the numbers from the first list followed by all of the numbers from the second list
- Implement **parallel-sum**, which takes two lists of numbers (of the same length) and returns a list of sums
- Implement **merge-lists**, which takes two *sorted* lists of numbers and returns a sorted list with all of the numbers

```
; parallel-sum : list-of-num list-of-num -> list-of-num  
  
(parallel-sum empty empty) "should be" empty  
  
(parallel-sum (list 1 3 5) (list 0 4 6))  
"should be" (list 1 7 11)
```

Multiple Complex Arguments

- Implement **append-lists**, which takes two lists of numbers and returns a list with all of the numbers from the first list followed by all of the numbers from the second list
- Implement **parallel-sum**, which takes two lists of numbers (of the same length) and returns a list of sums
- Implement **merge-lists**, which takes two *sorted* lists of numbers and returns a sorted list with all of the numbers

```
; merge-lists : list-of-num list-of-num -> list-of-num  
  
(merge-lists empty empty) "should be" empty  
  
(merge-lists (list 1 3 5) (list 0 4 6))  
"should be" (list 0 1 3 4 5 6)
```

Multiple Complex Arguments

- Implement **append-lists**, which takes two lists of numbers and returns a list with all of the numbers from the first list followed by all of the numbers from the second list
- Implement **parallel-sum**, which takes two lists of numbers (of the same length) and returns a list of sums
- Implement **merge-lists**, which takes two *sorted* lists of numbers and returns a sorted list with all of the numbers

```
; func : list-of-num list-of-num -> list-of-num
```

What template do we use for a function for *two* lists?

Multiple Complex Arguments

- Sometimes a complex argument is "along for the ride", so use the template for the other argument

```
(append-lists (list 1 3 5) (list 0 4 6))  
"should be" (list 1 3 5 0 4 6)
```

```
(define (append-lists a1 b1)  
  (cond  
    [(empty? a1) ...]  
    [(cons? a1)  
     ... (first a1)  
     ... (append-lists (rest a1) b1) ...]))
```

Multiple Complex Arguments

- Sometimes the arguments are exactly the same shape, so use essentially the one-argument template

```
(parallel-sum (list 1 3 5) (list 0 4 6))  
"should be" (list 1 7 11)
```

```
(define (parallel-sum a1 b1)  
  (cond  
    [(empty? a1) ...]  
    [(cons? a1)  
     ... (first a1) ... (first b1)  
     ... (parallel-sum (rest a1) (rest b1)) ...]))
```

Multiple Complex Arguments

- Sometimes you have to consider all possible combinations, so use a template that considers all combinations

```
(merge-lists (list 1 3 5) (list 0 4 6))  
"should be" (list 0 1 3 4 5 6)
```

```
(define (merge-lists al bl)  
  (cond  
    [(and (empty? al) (empty? bl)) ...]  
    [(and (empty? al) (cons? bl))  
     ... (first bl) ... (merge-lists al (rest bl)) ...]  
    [(and (cons? al) (empty? bl))  
     ... (first al) ... (merge-lists (rest al) bl) ...]  
    [(and (cons? al) (cons? bl))  
     ... (first al) ... (first bl)  
     ... (merge-lists (rest al) bl)  
     ... (merge-lists al (rest bl))  
     ... (merge-lists (rest al) (rest bl)) ...]))
```

- **Sorting a List**
- **Multiple Complex Inputs**
- **Natural Numbers**

Numbers to Generate Lists

- Implement `create-list`, which takes a non-negative integer n and produces a list of numbers from n to 0, inclusive

```
; create-list : num -> list-of-num
```

```
(create-list 3) "should be" (list 3 2 1 0)
```

```
(create-list 0) "should be" (list 0)
```

The template for `num` isn't much help:

```
(define (func-for-num n)
  ...)
```

But `create-list` actually takes a *natural number*

Natural Numbers

```
; A nat is either  
; - 0  
; - (add1 nat)
```

Examples:

0

(add1 0)

(add1 (add1 (add1 0)))

These examples have shortcuts

0, 1, and 3

but the long forms correspond to the template

Template for Natural Numbers

```
    ; A nat is either  
    ; - 0  
    ; - (add1 nat)
```

```
(define (func-for-nat n)  
  (cond  
    [(zero? n) ...]  
    [else ... (func-for-nat (sub1 n)) ...]))
```

```
(define (create-list n)  
  (cond  
    [(zero? n) (list 0)]  
    [else (cons n (create-list (sub1 n)))]))
```

Generating the List the Other Way

- Implement `create-up-list`, which takes a non-negative integer n and produces a list of numbers from 0 to n inclusive

```
; create-up-list : num -> list-of-num

(create-list 3) "should be" (list 0 1 2 3)

(create-list 0) "should be" (list 0)

(define (create-up-list n)
  (cond
    [(zero? n) (list 0)]
    [else
     ... n
     ... (create-up-list (sub1 n)) ...]))

; uh oh... can't cons onto recur result
```

Using Subtraction to Count Up

```
(define (create-up-list n)
  (create-up-to-n-list n n))
```

; Creates a list with d elements before n

```
(define (create-up-to-n-list d n)
  (cond
    [(zero? d) (list n)]
    [else
     (cons (- n d)
           (create-up-to-m-list (sub1 d) n))]))
```

... or replace d with $m = (+ d n)$

As d goes down, m goes up...

Counting Up Directly

```
(define (create-up-list n)
  (create-m-to-n-list 0 n))

; Creates a list from m to n
(define (create-m-to-n-list m n)
  (cond
    [(= m n) (list n)]
    [else
     (cons m
           (create-m-to-n-list (add1 m) n))]))
```

Use the stepper to see how it works

Similar ideas work for counting by fives, counting down to 20, etc.
